

Zion Pharma - nootropics

SEMAX and SELANK - peptides administered intranasally.

Instructions for preparing a solution for intranasal administration.

One kit includes four items:

1. A vial with lyophilized sterile peptide.
2. Atomizer containing bacteriostatic water - 1% benzyl alcohol aqueous solution (5 ml of liquid).
3. 5 ml syringe.
4. Needle for collecting the liquid.

The procedure for making the solution:

1. Prepare yourself a piece of table on which you will prepare the solution.
2. Sit on a chair at the table and spread the whole kit in front of you.
3. Take the needle out of the package and remove the syringe from the package. Put the needle on the syringe. Put the syringe with the needle on the table.
4. Take the atomizer containing the liquid in your hand. Holding the atomizer upright, unscrew the entire plastic dispenser from the bottle. Set it aside.
5. Take a syringe with a needle and take the liquid into the syringe from the bottle (it does not have to be all of it). Put the bottle and the syringe with the liquid aside.
6. Take the powder vial in your hand and tear off the plastic lid from it. Set the detached lid aside. It will no longer be needed.
7. Hold the vial in one hand and the syringe with the liquid in the other.
8. Pierce the rubber membrane near its center with a needle (the membrane is thick and quite hard).
9. Inject the liquid from the syringe into the ampoule (there is almost a vacuum in the ampoule, so the liquid from the syringe will be sucked into the ampoule).
10. The powder will dissolve quickly. You can remove the syringe with the needle from the ampoule for this time. You can gently shake the ampoule.
11. When the powder is completely dissolved, insert the needle through the membrane again. Collect all the liquid with dissolved powder into the syringe.
12. Set the empty ampoule aside. It will no longer be needed. Take the bottle in your hand and inject all the liquid from the syringe into the bottle.
13. Put the syringe aside and screw the plastic dispenser onto the bottle.
14. Done.

Note: the liquid is not and does not have to be sterile. On the other hand, it should be clean.

The atomizer dispenses the nasal fluid in many very thin streams. The dispenser should be in an upright position during "puffing".

A single dose (one "puff") contains 0.138 mg of the active ingredient (Selank or Semax). The entire atomizer contains about 36 "puffs". Store the solution in the atomizer in the refrigerator (not in the freezer!).

Note: the product is not intended for human use. It is also not a medicinal product as defined by law. This instruction was created for educational purposes.
